Important information for all users!

If you are not familiar in installing this software you may prefer downloading a "ready to start" package from http://www.c-mor.com!

C-MOR is available as VMware Player and as VirtualBox version. Both version run as simple click-and-play applications.

If you do not have a virtualization software installed yet, then we recommend download VirtualBox. Install this software first. You can get it from

http://www.virtualbox.org

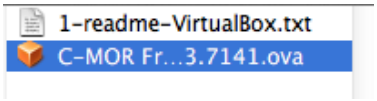

for free. It's available for Windows, MacOS and Linux!

Once it is installed you simply download the C-MOR VirtualBox version from

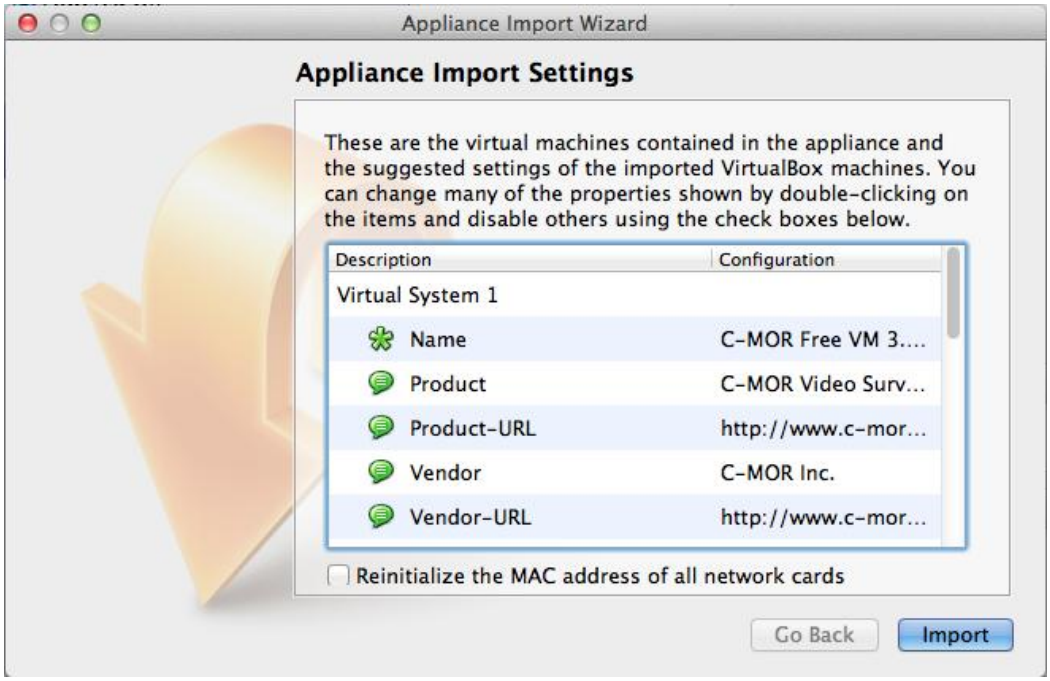

http://www.c-mor.com/video-surveillance/download-vm.php

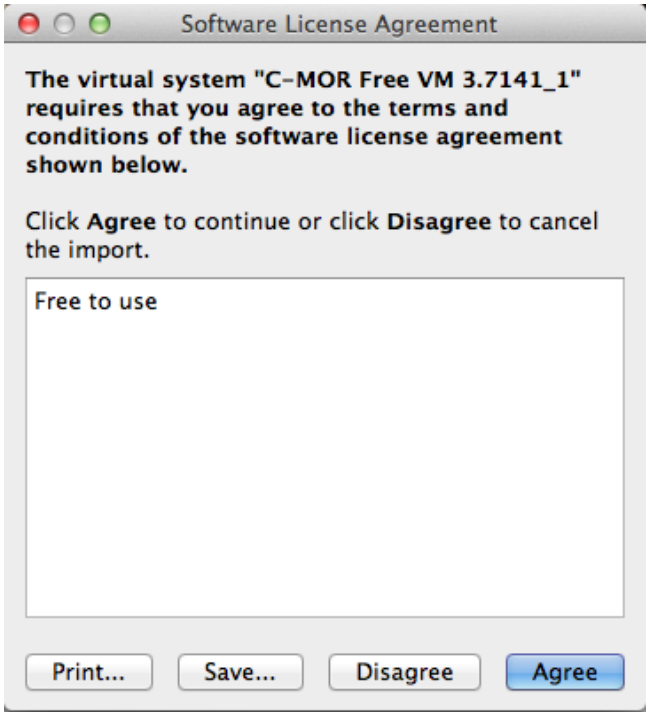

and click it to start. After the start up you may access C-MOR by typing http://192.168.1.2 or whatever IP address you set up in the console Window which runs in VirtualBox. Now you can start recording your cameras!

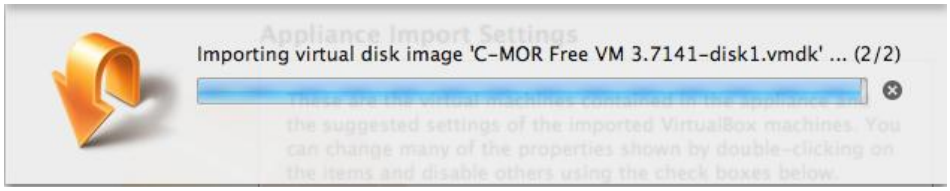

That is what it looks like. You double click on the file which you downloaded with the C-MOR-VirtualBox version:

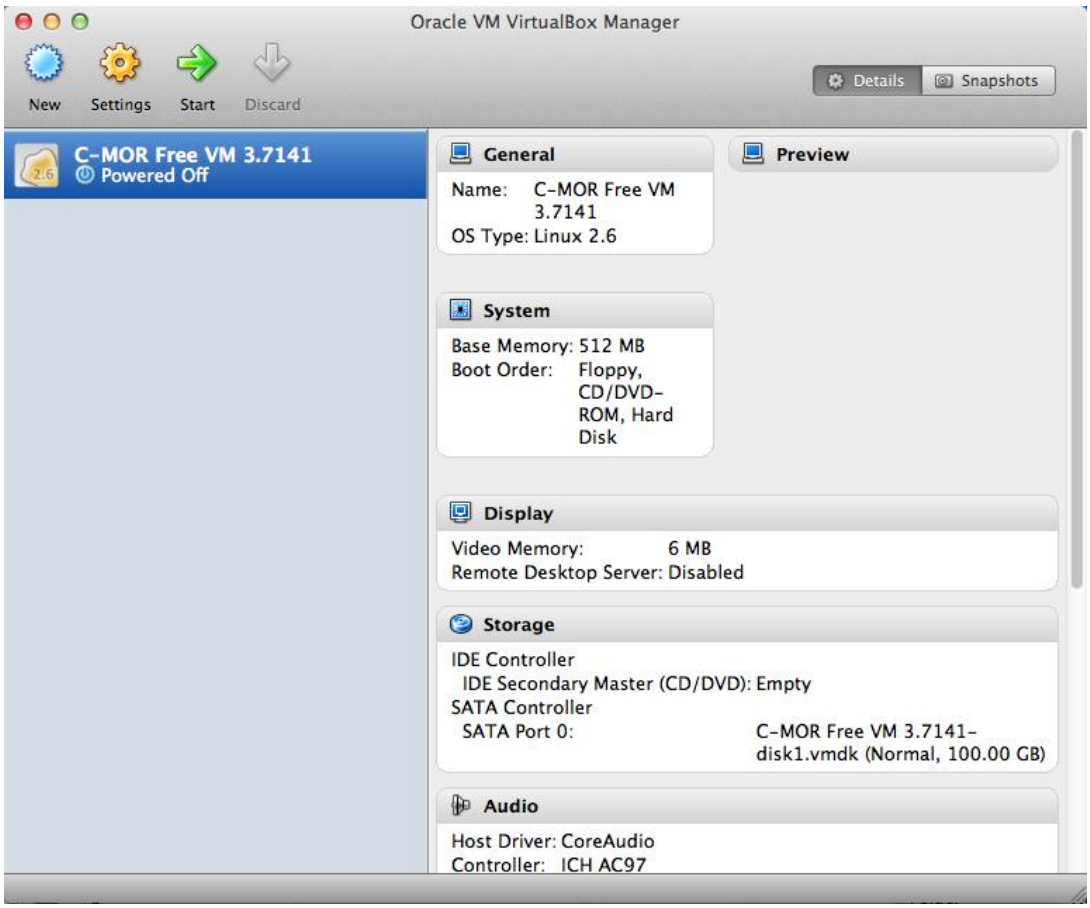

The Import dialog pops up:

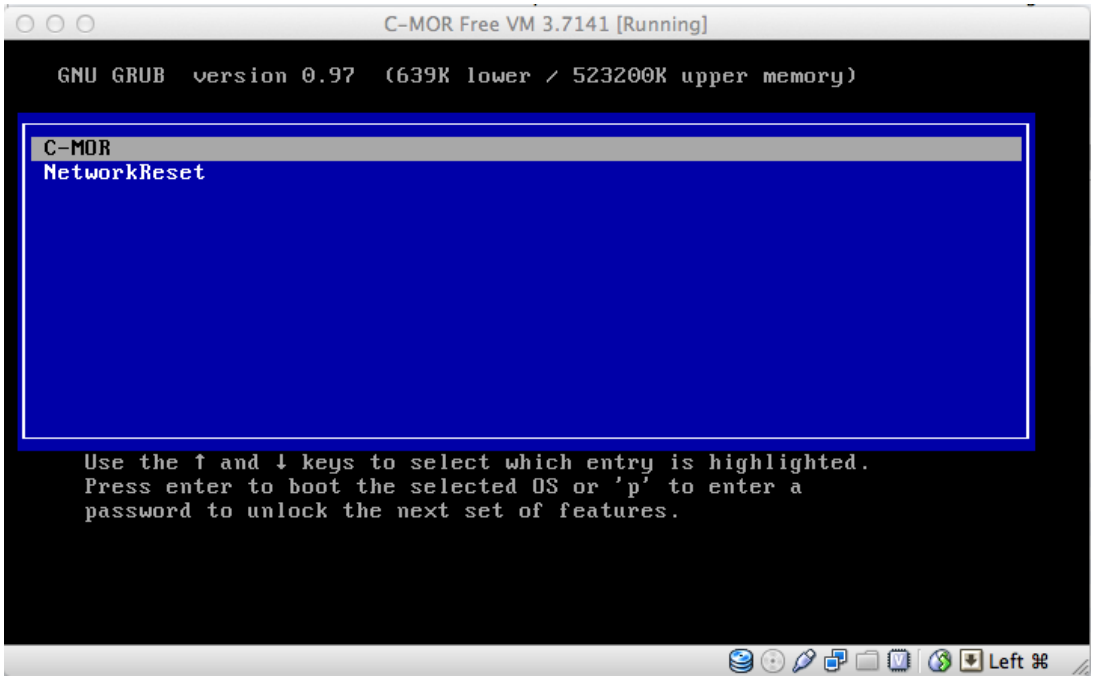

Double click on the C-MOR Free VM on the left and another window pops up with the startup of C-MOR VirtualBox version:

C-MOR starts now and reboots once!
